

1. Total Sales Analysis

I created a monthly area chart in Power BI to track overall sales trends over time, helping identify peak sales periods and seasonal patterns.

2. Profitability Analysis

Using Power BI measures, I evaluated total profit across different dimensions (e.g., product, region, retailer) to see where profitability is highest.

3. Sales Volume Analysis

I analyzed total units sold to understand product demand, using bar charts to compare volume across products and retailers.

4. Pricing Strategy

By calculating the average price per unit in Power BI, I assessed whether pricing strategies vary significantly by product category or region.

5. Margin Analysis

I computed average profit margin through DAX measures to evaluate the overall profitability of sales and identify low-margin areas.

6. Geographic Sales View

I used a bar chart to show total sales by state, making regional performance easy to compare visually.

7. Regional Contribution

A donut chart was built to display the percentage contribution of each region to total sales.

8. Product & Retailer Breakdown

Two separate bar charts were created to visualize total sales distribution across Adidas products and different retailers.
